(Dated: February 2, 2008)

We present the calculations of the supersymmetric QCD corrections to the total cross sections for single top production at the Fermilab Tevatron and the CERN Large Hadron Collider in the minimal supersymmetric standard model. Our results show that for the s-channel and t-channel, the supersymmetric QCD corrections are at most about 1%, but for the associated production process $pp \to tW$, the supersymmetric QCD corrections increase the total cross sections significantly, which can reach about 6% for most values of the parameters, and the supersymmetric QCD corrections should be taken into consideration in the future high precision experimental analysis for top physics.

I. INTRODUCTION

The search for single top quark production is one of the major aims of both the Fermilab Tevatron and the CERN Large Hadron Collider(LHC) [1, 2], because it can probe the electroweak sector of the Standard Model(SM), in contrast with the dominant QCD pair production mechanism, and provide a consistency check on the measured parameters of the top quark in the QCD pair production process [3, 4, 5, 6]. Further more, the mass of top quark is comparable to the electroweak(EW) symmetry breaking scale, and it can play a role of wonderful probe for the EW symmetry breaking mechanism and new physics, especially the minimal supersymmetry standard model(MSSM) as a very popular model beyond the SM, via non-standard couplings [4, 7, 8, 9, 10, 11, 12, 13], loop effects [14, 15, 16, 17, 18], etc., in the processes for single top quark production.

At the LHC single top quarks are produced primarily via the t-channel [19],

$$q + b \to q' + t,$$

the quark annihilation process(s-channel) [20, 21],

$$q + \bar{q}' \to t + \bar{b},$$

and the associated production process [3, 22],

$$g + b \to t + W^-,$$

which can reliably be predicted in the SM, and their leading order(LO) results are summarized in Table I [2]. As a high-luminosity LHC would run soon and allow accurate measurements of these cross sections with a statistical uncertainty of less than 2% [1, 22, 23, 24, 25], at this level of experimental accuracy, calculations of the radiative corrections are necessary to test the predictions of the SM and to investigate loop effects arising from new physics. The QCD corrections to the total cross sections of the three channels are about -10%,

TABLE I: The LO results for single top production at the LHC

process:	t-channel	s-channel	Wt
$\sigma(pb)$:	156 ± 8	6.6 ± 0.6	$14.0^{+3.8}_{-2.8}$

+50% and +50%, respectively [2, 22, 26, 27, 28, 29]. For t-channel, the SM EW corrections are about 10% and the supersymmetric(SUSY) EW corrections are a few percent [30] at the LHC, for s-channel, the combined effects of SUSY QCD, SUSY EW and the Yukawa couplings can exceed 10% for small $\tan\beta(< 2)$ but are only a few percent for $\tan\beta > 2$ at the Tevatron [16, 17], and for the associated production at the LHC, the SM EW and the SUSY corrections have been calculated and analyzed in Ref.[31]. But at the LHC, the SUSY QCD corrections to the three channels have not been calculated yet. As the associated production process involves the QCD coupling in initial state, obviously, the SUSY QCD corrections are significant for this channel. In order to fill in the blanks in the relevant radiative corrections to the channels considered here, in this paper we present the calculations of the SUSY QCD corrections to the three channels at the CERN LHC, mainly concerning the associated production channel, and also give the updated numerical calculations to the s-channel process at the Tevatron[32].

Our paper is organized as follows. In Section II we will give the analytic results in terms of the well-known standard notation of one-loop Feynman integrals for the associated channel, s-channel and t-channel. In Section III we will present our numerical results with discussions of their implications.

II. ANALYTIC RESULTS

A. Associated Production

In our calculations we use dimensional reduction to control all the ultraviolet divergences in the virtual loop corrections. We adopt the on-mass-shell renormalization scheme[33] for the top quark mass and the wave functions renormalization, and set all the other quark masses as zero. The QCD coupling constant g_s is renormalized in the modified minimal subtraction scheme($\overline{\text{MS}}$) except that the divergences associated with the top quark and colored SUSY particle loops are subtracted at zero momentum[34]. Denoting ψ_{q0}, m_{q0}, g_{s0} and $A_{\mu 0}$ as bare quark wave functions, quark masses, strong coupling constant and gluon wave function respectively, the relevant renormalization constants are then defined as

$$\begin{aligned}
\psi_{q0} &= (1+\delta Z_L^{qq})^{1/2}\psi_{qL} + (1+\delta Z_R^{qq})^{1/2}\psi_{qR}, \\
m_{q0} &= m_q + \delta m_q,
\end{aligned}$$

$$\begin{aligned} A_{\mu 0} &= (1+\delta Z_{AA})^{1/2} A_{\mu}, \\ g_{s0} &= (1+\delta Z_g) g_s, \end{aligned} \tag{1}$$

After calculating the self-energy and vertex diagrams in Fig.1, we obtain the explicit expressions of all necessary renormalization constants as follows:

$$\begin{aligned} \delta Z_g &= -\frac{\alpha_s(\mu^2)}{4\pi}\{\frac{\beta_0}{2}[\frac{1}{\epsilon}-\gamma_E+\ln(4\pi)]+\frac{N}{3}\ln(\frac{M_{\tilde{g}}^2}{\mu^2})+\sum_{u=u,c,t}^{i=1,2}\frac{1}{12}\ln(\frac{M_{\tilde{u}_i}^2}{\mu^2})+\sum_{d=d,s,b}^{i=1,2}\frac{1}{12}\ln(\frac{M_{\tilde{d}_i}^2}{\mu^2})\}, \\ \delta Z_{AA} &= -\frac{3\alpha_s}{2\pi}B_1(0,M_{\tilde{g}}^2,M_{\tilde{g}}^2)+\frac{3\alpha_s}{\pi}\frac{\partial}{\partial p^2}B_{00}(0,M_{\tilde{g}}^2,M_{\tilde{g}}^2) \\ &\quad -\frac{\alpha_s}{2\pi}\sum_u^3\sum_i^2\frac{\partial}{\partial p^2}B_{00}(0,M_{\tilde{u}_i}^2,M_{\tilde{u}_i}^2)-\frac{\alpha_s}{2\pi}\sum_d^3\sum_i^2\frac{\partial}{\partial p^2}B_{00}(0,M_{\tilde{d}_i}^2,M_{\tilde{d}_i}^2), \\ \delta m_t &= \frac{2\alpha_s M_{\tilde{g}}}{3\pi}\sum_i^2 B_0(m_t^2,M_{\tilde{g}}^2,M_{\tilde{t}_i}^2)U_{i1}^t U_{i2}^{t*}+\frac{\alpha_s m_t}{3\pi}\sum_i^2 B_1(m_t^2,M_{\tilde{g}}^2,M_{\tilde{t}_i}^2)(U_{i1}^t U_{i1}^{t*}+U_{i2}^t U_{i2}^{t*}), \\ \delta Z_{(L,R)}^{tt} &= -\frac{2\alpha_s}{3\pi}\sum_i^2 B_1(m_t^2,M_{\tilde{g}}^2,M_{\tilde{t}_i}^2)U_{i(1,2)}^t U_{i(1,2)}^{t*}-\frac{4\alpha_s M_{\tilde{g}} m_t}{3\pi}\sum_i^2\frac{\partial}{\partial p^2}B_0(m_t^2,M_{\tilde{g}}^2,M_{\tilde{t}_i}^2)U_{i1}^t U_{i2}^{t*} \\ &\quad -\frac{2\alpha_s m_t^2}{3\pi}\sum_i^2\frac{\partial}{\partial p^2}B_1(m_t^2,M_{\tilde{g}}^2,M_{\tilde{t}_i}^2)(U_{i1}^t U_{i1}^{t*}+U_{i2}^t U_{i2}^{t*}), \\ \delta Z_{(L,R)}^{qq} &= -\frac{2\alpha_s}{3\pi}\sum_i^2 B_1(0,M_{\tilde{g}}^2,M_{\tilde{q}_i}^2)U_{i(1,2)}^q U_{i(1,2)}^{q*} \qquad q=u,d,s,c,b, \end{aligned} \tag{2}$$

where $\beta_0=[-\frac{2}{3}(N+1)-\frac{1}{3}(n_f+1)]$, $B_{ijk\cdots}$ are the two-point functions, U_{ij}^q are the mixing matrices of the squarks, γ_E is the Euler constant, and μ is the renormalization scale.

Including the SUSY QCD corrections, the renormalized amplitudes can be written as

$$M_{ren}^A = M_0^A + M_{vir}^A + M_{count}^A, \tag{3}$$

where M_0^A is the LO amplitude, M_{vir}^A represents the SUSY QCD corrected amplitude from the one-loop self-energy, vertex, and box diagrams, and M_{count}^A is the corresponding counterterm for the self-energy corrections and vertex corrections, respectively.

The related Feynman diagrams which contribute to the LO amplitude M_0^A are shown in Fig.2 (a) and (b). The LO amplitude M_0^A is given by

$$\begin{aligned} M_0^A &= M_s^A + M_t^A \\ &= \frac{e g_s V_{tb}}{\sqrt{2}\sin\theta_W}[\frac{1}{s}(2A_{10}-A_7-2A_8)+\frac{1}{t-m_t^2}(2A_{15}-2A_9-A_7)], \end{aligned} \tag{4}$$

where V_{ij} are the elements of CKM matrix, s, t, u are the Mandelstam invariants, which are defined as,

$$\begin{aligned} s &= (k_1+k_2)^2 = (k_3+k_4)^2, \\ t &= (k_1-k_3)^2 = (k_2-k_4)^2, \\ u &= (k_1-k_4)^2 = (k_2-k_3)^2, \end{aligned} \qquad (5)$$

where k_1 and k_2 denote the momentum of the incoming particles, k_3 and k_4 the outgoing particles, while A_m are the reduced standard matrix elements given by

$$\begin{aligned}
A_{1,22} &= (\epsilon_1^a \cdot \epsilon_4^*)\bar{u}^b(k_3)P_{R,L}u^c(k_2)(T^a)_{bc}, \\
A_{2,3} &= (\epsilon_1^a \cdot k_2)(\epsilon_4^* \cdot k_{1,2})\bar{u}^b(k_3)P_R u^c(k_2)(T^a)_{bc}, \\
A_{4,5} &= (\epsilon_1^a \cdot k_3)(\epsilon_4^* \cdot k_{2,1})\bar{u}^b(k_3)P_R u^c(k_2)(T^a)_{bc}, \\
A_{6,17} &= \bar{u}^b(k_3)P_{R,L} \not{\epsilon}_1^a \not{\epsilon}_4^* u^c(k_2)(T^a)_{bc}, \\
A_{7,27} &= \bar{u}^b(k_3)P_{R,L} \not{\epsilon}_1^a \not{\epsilon}_4^* \not{k}_1 u^c(k_2)(T^a)_{bc}, \\
A_{8,9} &= (\epsilon_1^a \cdot k_{2,3})\bar{u}^b(k_3)P_R \not{\epsilon}_4^* u^c(k_2)(T^a)_{bc}, \\
A_{10,32} &= (\epsilon_1^a \cdot \epsilon_4^*)\bar{u}^b(k_3)P_{R,L} \not{k}_1 u^c(k_2)(T^a)_{bc}, \\
A_{11,12} &= (\epsilon_4^* \cdot k_2)(\epsilon_1^a \cdot k_{2,3})\bar{u}^b(k_3)P_R \not{k}_1 u^c(k_2)(T^a)_{bc}, \\
A_{13,14} &= (\epsilon_4^* \cdot k_1)(\epsilon_1^a \cdot k_{2,3})\bar{u}^b(k_3)P_R \not{k}_1 u^c(k_2)(T^a)_{bc}, \\
A_{15,16} &= (\epsilon_4^* \cdot k_{1,2})\bar{u}^b(k_3)P_R \not{\epsilon}_1^a u^c(k_2)(T^a)_{bc}, \\
A_{18,19} &= (\epsilon_4^* \cdot k_{1,2})\bar{u}^b(k_3)P_R \not{\epsilon}_1^a \not{k}_1 u^c(k_2)(T^a)_{bc}, \\
A_{20,21} &= (\epsilon_1^a \cdot k_2)(\epsilon_4^* \cdot k_{1,2})\bar{u}^b(k_3)P_L u^c(k_2)(T^a)_{bc}, \\
A_{23,24} &= (\epsilon_1^a \cdot k_3)(\epsilon_4^* \cdot k_{2,1})\bar{u}^b(k_3)P_L u^c(k_2)(T^a)_{bc}, \\
A_{25,26} &= (\epsilon_4^* \cdot k_{1,2})\bar{u}^b(k_3)P_L \not{\epsilon}_1^a u^c(k_2)(T^a)_{bc}, \\
A_{28,29} &= (\epsilon_4^* \cdot k_{1,2})\bar{u}^b(k_3)P_L \not{\epsilon}_1^a \not{k}_1 u^c(k_2)(T^a)_{bc}, \\
A_{30,31} &= (\epsilon_1^a \cdot k_{2,3})\bar{u}^b(k_3)P_L \not{\epsilon}_4^* u^c(k_2)(T^a)_{bc}, \\
A_{33,35} &= (\epsilon_4^* \cdot k_{2,1})(\epsilon_1^a \cdot k_2)\bar{u}^b(k_3)P_L \not{k}_1 u^c(k_2)(T^a)_{bc}, \\
A_{34,36} &= (\epsilon_1^a \cdot k_3)(\epsilon_4^* \cdot k_{2,1})\bar{u}^b(k_3)P_L \not{k}_1 u^c(k_2)(T^a)_{bc}, \\
A_{37,38} &= (\epsilon_1^a \cdot k_{3,2})\bar{u}^b(k_3)P_L \not{\epsilon}_4^* \not{k}_1 u^c(k_2)(T^a)_{bc}.
\end{aligned} \qquad (6)$$

The relevant Feynman diagrams of the SUSY QCD corrected amplitude M_{vir}^A are shown in Fig.3, and M^A_{vir} can be written as

$$M^A_{vir} \;=\; M^A_{self} + M^A_{vertex} + M^A_{box}, \tag{7}$$

where M^A_{self}, M^A_{vertex} and M^A_{box} come from self-energy diagrams, vertex diagrams and box-diagrams as shown in Fig.3, respectively. Their explicit expressions are given by

$$M^A_{self} = \sum_{m=1}^{38} f^{self}_m A_m, \quad M^A_{vertex} = \sum_{m=1}^{38} f^{v}_m A_m, \quad M^A_{box} = \sum_{m=1}^{38} f^{b}_m A_m, \tag{8}$$

where f^{self}_m, f^v_m, f^b_m are the form factors, which are given explicitly in Appendix.

The counterterms M^A_{count}, the corresponding diagrams of which are shown in Fig.4, can be written as follows

$$M^A_{count} \;=\; \delta M^A_{self} + \delta M^A_{vertex}, \tag{9}$$

with

$$\begin{aligned}
\delta M^A_{self} \;&=\; \delta M^1_{self} + \delta M^2_{self} \\
&=\; \frac{e g_s V_{tb}}{2\sqrt{2}\sin\theta_W}\{\;\frac{A_{17}}{t-m_t^2}[m_t(\delta Z^{tt}_L - \delta Z^{tt}_R) + 2\delta m_t] - \frac{2\delta Z^{bb}_L}{s}(A_7 - 2A_8 + 2A_{10}) \\
&\quad + \frac{2}{(t-m_t^2)^2}(A_7 + 2A_9 - 2A_{15})[(m_t^2 - t)\delta Z^{tt}_L + 2m_t\delta m_t]\;\}, \qquad (10) \\
\delta M^A_{vertex} \;&=\; \sum_{n=1}^{4}\delta M^n_{vertex}, \qquad (11) \\
\delta M^1_{vertex} \;&=\; \frac{e g_s V_{tb}}{2\sqrt{2}s\sin\theta_W}(A_7 + 2A_8 - 2A_{10})(\delta Z^{bb}_L + \delta Z^{tt}_L), \\
\delta M^2_{vertex} \;&=\; \frac{e g_s V_{tb}}{2\sqrt{2}\sin\theta_W(t-m_t^2)}(A_7 + 2A_9 - 2A_{15})(\delta Z^{bb}_L + \delta Z^{tt}_L), \\
\delta M^3_{vertex} \;&=\; \frac{e g_s V_{tb}}{2\sqrt{2}\sin\theta_W(t-m_t^2)}[2m_t A_{17}(\delta Z^{tt}_R - \delta Z^{tt}_L) \\
&\qquad + (A_7 + 2A_9 - 2A_{15})(2\delta Z_g + 2\delta Z^{tt}_L + \delta Z_{AA})], \\
\delta M^4_{vertex} \;&=\; \frac{e g_s V_{tb}}{2\sqrt{2}s\sin\theta_W}(2\delta Z_g + \delta Z_{AA} + 2\delta Z^{bb}_L)(A_7 + 2A_8 - 2A_{10}). \qquad (12)
\end{aligned}$$

The partonic cross section can be written as

$$\hat{\sigma} \;=\; \int_{-1}^{1} \mathrm{d}z \frac{1}{32\pi s^2}\lambda^{1/2}\overline{|M^A_{ren}|^2} = \int_{t_-}^{t_+} \mathrm{d}t \frac{1}{16\pi s^2}\overline{|M^A_{ren}|^2}, \tag{13}$$

where $\lambda \equiv (s - m_t^2 + m_W^2)^2 - 4sm_W^2$, $t_\pm = \frac{1}{2}[m_t^2 + m_W^2 - s \pm \lambda^{1/2}]$, and $\overline{|M^A_{ren}|^2}$ is the renormalized amplitude squared given by

$$\overline{|M^A_{ren}|^2} \;=\; \overline{\sum}|M^A_0|^2 + 2\mathrm{Re}\overline{\sum} M^A_0[M^A_{vir} + M^A_{count}]^\dagger, \tag{14}$$

where the colors and spins of the outgoing particles have been summed over, and the colors and spins of incoming ones have been averaged over.

The total cross section at the LHC is obtained by convoluting the partonic cross section with the parton distribution functions (PDFs) $G_{g,b/p}$ in the proton:

$$\sigma = \int_{\tau_0}^{1} \mathrm{d}x_1 \int_{\tau_0/x_1}^{1} \mathrm{d}x_2 [G_{g/p}(x_1,\mu_f) G_{b/p}(x_2,\mu_f) + (x_1 \leftrightarrow x_2)] \hat{\sigma}(\tau S), \tag{15}$$

where μ_f is the factorization scale and $S = (P_1 + P_2)^2$, P_1 and P_2 are the four-momentum of the incident hadrons, $\tau_0 = \frac{(m_W + m_t)^2}{S}$, $\tau = x_1 x_2$, and x_1, x_2 are the longitudinal momentum fractions of initial partons in the hadrons.

B. s-channel and t-channel

For convenience, we first define the reduced standard matrix elements F_i as follows:

$$\begin{aligned} F_{1,2} &= \bar{v}(k_2) P_{R,L} \gamma^\mu u(k_1) \bar{u}(k_3) P_R \gamma_\mu v(k_4), \\ F_{3,4} &= \bar{v}(k_2) P_{R,L} u(k_1) \bar{u}(k_3) P_R \not{k}_1 v(k_4), \\ F_{5,6} &= \bar{u}(k_3) P_{R,L} v(k_4) \bar{v}(k_2) P_R \not{k}_3 u(k_1), \\ F_{7,8} &= \bar{v}(k_2) P_{R,L} u(k_1) \bar{u}(k_3) P_L v(k_4), \\ F_9 &= \bar{v}(k_2) P_R \gamma^\mu u(k_1) \bar{u}(k_3) P_L \gamma_\mu v(k_4), \end{aligned} \tag{16}$$

which will appear in the amplitudes of s-channel and t-channel below.

For s-channel, the diagrams which contribute to the LO amplitude M_0^s are shown in Fig.2 (c). The LO amplitude M_0^s is

$$M_0^s = - \sum_{\substack{q=u,c \\ q'=d,s,b}} \frac{2\pi\alpha V_{tb} V_{qq'}^*}{\sin^2\theta_W (s - m_W^2)} F_1, \tag{17}$$

The virtual corrections M_{vir}^s contains the radiative corrections from the one-loop vertex diagrams, which are shown in Fig.5 (a) and (b), and we can write M_{vir}^s as:

$$M_{vir}^s = \sum_{m=1}^{9} f_m^s F_m, \tag{18}$$

where $f_m^s (m = 1, 2, \cdots, 9)$ are form factors, which are given explicitly in Appendix.

The corresponding counterterm can be written as

$$M_{count}^s = - \sum_{\substack{q=u,c \\ q'=d,s,b}} \frac{\pi\alpha V_{tb} V_{qq'}^*}{\sin^2\theta_W (s - m_W^2)} (\delta Z_L^{bb} + \delta Z_L^{tt} + \delta Z_L^{qq} + \delta Z_L^{q'q'}) F_1, \tag{19}$$

where the expressions of $\delta Z_L^{ii}(i=u,d,s,c,b,t)$ are shown in Eq.(2).

According to the crossing symmetry, we have the similar expressions in t-channel as in s-channel. We replace the variable s by t in Eq.(17), (18) and (19), then use the different summation over quark flavors, and change the indices of the quarks in the initial and final states. For example,

$$\begin{aligned}
M_0^t &= M_0^s(s\to t,\sum_{q,q'}\to\sum_{\{qq'\}}) = -\sum_{\{qq'\}}\frac{4\pi\alpha V_{tb}V_{qq'}^*}{\sin^2\theta_W(t-m_W^2)}F_1',\\
M_{vir}^t &= M_{vir}^s(s\to t,\sum_{q,q'}\to\sum_{\{qq'\}}) = \sum_{m=1}^{9} f_m^t(s\to t,\sum_{q,q'}\to\sum_{\{qq'\}})F_m'\\
M_{count}^t &= M_{count}^s(s\to t,\sum_{q,q'}\to\sum_{\{qq'\}})\\
&= -\sum_{\{qq'\}}\frac{2\pi\alpha V_{tb}V_{qq'}^*}{\sin^2\theta_W(t-m_W^2)}(\delta Z_L^{qq}+\delta Z_L^{q'q'}+\delta Z_L^{bb}+\delta Z_L^{tt})F_1',
\end{aligned}\tag{20}$$

with

$$F_m' \equiv F_m(v(k_4)\to u(k_2),\bar{v}(k_2)\to u(k_3)).$$

Here the index pair $\{qq'\}$ takes on the flavors $\{ud,us,ub,cd,cs,cb\}$. The other formulas for cross sections are the same as in associated production.

III. NUMERICAL RESULTS AND DISCUSSIONS

In this section, we present the numerical results for the SUSY QCD corrections to the three channels of single top production at the LHC. For comparison, we also present the numerical results for s-channel at the Tevatron[32]. In our numerical calculations, we use the following set of the SM parameters [35]:

$$m_t = 175\text{GeV},\qquad \alpha_{ew}(M_W)=1/128,\qquad \alpha_s(M_Z)=0.118,$$

and all light quark masses are set to be zero, and the CKM matrix elements are taken to be the values shown in Ref.[35].

The running QCD coupling $\alpha_s(Q)$ is evaluated at two-loop order[36], and the CTEQ6M PDFs[37] are used throughout this paper to calculate cross sections. For simplicity, we neglect the b-quark mass. We choose $\mu_r = \mu_f = m_t + m_W$ for the renormalization and factorization scales in associated production and choose $\mu_r = \mu_f = m_t$ for the renormalization and factorization scales in the other two channels.

Besides, the values of the MSSM parameters taken in our numerical calculations are constrained within the minimal supergravity scenario(mSUGRA) [38], in which there are only five free input parameters at the grand unification where $M_{1/2}, M_0, A_0, \tan\beta$ and the sign of μ, where $M_{1/2}, M_0, A_0$ are, respectively, the universal gaugino mass, scalar mass, and the trilinear soft breaking parameter in the superpotential. Given these parameters, all the MSSM parameters at the weak scale are determined in the mSUGRA scenario by using the program package SUSPECT 2.3 [39], where we set $A_0 = -200$GeV and $\mu > 0$.

A. Associated Production

We define the K factor as the ratio of the SUSY QCD corrected cross sections to LO total cross sections, calculated using the CTEQ6M PDFs. Fig.6 shows the K factors as functions of $M_{\tilde{g}}$ ($M_{1/2}$) for the associated production process $pp \to tW$ at the LHC for $\tan\beta = 5, 20$ and 35, respectively. From Fig.6, we can see that the differences among the results are small for different $\tan\beta$, and K factors increase with the increasing $M_{\tilde{g}}$ for small $M_{\tilde{g}}$($\lesssim$ 160GeV), while decrease with the increasing $M_{\tilde{g}}$ for large $M_{\tilde{g}}$($\gtrsim$ 160GeV), and, in general, the K factors are about 1.06.

In Fig.7 we show the dependence of the K factors on $M_{\tilde{t}_1}(M_0)$ for different $\tan\beta$. Fig.7 shows that the K factors have the similar behaviors as those shown in Fig.6, and are also about 1.06 in general.

To compare with Fig.7, we present Fig.10 which takes the similar parameters as those used in Fig.7 but $M_{1/2} = 70$GeV, where the gluino mass $M_{\tilde{g}}$ lies in the range 220GeV $\lesssim M_{\tilde{g}} \lesssim$ 250GeV for all values of M_0 and $\tan\beta$ we assumed here. Fig.10 shows that SUSY QCD corrections are not sensitive to $\tan\beta$, which is consistent with Fig.7.

Fig.8 gives the K factors as functions of $M_{\tilde{g}}(M_{1/2})$ for different M_0, assuming $\tan\beta = 5$. In Fig.8 we can see that there are large differences between different M_0 when $M_{\tilde{g}}$ becomes small, but these curves approach each other when $M_{\tilde{g}}$ becomes large because of the decoupling of heavy gluino($M_{\tilde{g}} \gtrsim$ 450GeV). The K factors are about 1.06 for $M_{\tilde{g}} \lesssim$ 500GeV, and become small slowly with increasing $M_{\tilde{g}}$, but the K factors decrease rapidly when

$M_{\tilde{g}} \lesssim 150\text{GeV}$ for $M_0 = 150\text{GeV}$.

In Fig.9 we present the K factors as functions of $M_{\tilde{t}_1}(M_0)$, assuming $\tan\beta = 5$, and $M_{1/2} = 40, 70$ and 100GeV, respectively. From Fig.9, we find the similar results as those shown in Fig.8, i.e. the K factors are about 1.06 for most values of $M_{\tilde{t}_1}$ considered, and become small slowly with increasing $M_{\tilde{t}_1}$.

In Fig.11 we present the LO and the SUSY QCD corrected cross sections as functions of renormalization and factorization scales $\mu/\mu_0(\mu_f = \mu_r = \mu, \mu_0 = m_t + m_W)$, respectively, assuming $\tan\beta = 5$, $M_0 = 150\text{GeV}$, $M_{1/2} = 70\text{GeV}$, $A_0 = -200\text{GeV}$ and $\mu > 0$. This figure shows that the scale dependence of the SUSY QCD corrected total cross section is a little larger than that of the LO cross section because of the running effects of the extra α_s in SUSY QCD corrections. We can recover the LO results of scale dependence by dividing α_s in the SUSY QCD corrections. After comparison with the NLO QCD corrections[28], we can see that if the NLO QCD corrections are also included, $\mathcal{O}(\alpha_s)$ corrections still improve the scale dependence.

B. s-channel and t-channel

For the s-channel process $pp \to t\bar{b}$, in Fig.12 (a)-(b), we display the K factors as functions of $M_{\tilde{g}}(M_{1/2})$ and $M_{\tilde{t}_1}(M_0)$, respectively, assuming $M_0 = 150, 300\text{GeV}$ and $M_{1/2} = 40, 70, 100\text{GeV}$. Fig.12 shows that the K factors are about 1.01 for some favorable parameters, otherwise, the K factors approach the unit value.

In Fig.13 (a)-(b), the K factors are plotted as functions of $M_{\tilde{g}}(M_{1/2})$ and $M_{\tilde{t}_1}(M_0)$, respectively, assuming $\tan\beta = 5, 20, 35$. Fig.13 shows that the K factors can reach 1.01 for light $M_{\tilde{g}}$ and $M_{\tilde{t}_1}$, respectively, and are not sensitive to $\tan\beta$.

In Fig.14, we display the K factors as functions of $M_{\tilde{t}_1}$ for the s-channel process $p\bar{p} \to t\bar{b}$ at the Tevatron Run II. We find that the K factors can reach 1.01 for small $M_{\tilde{t}_1}$, and decrease rapidly as $M_{\tilde{t}_1}$ increases. These results are consistent with that shown in Fig.3 of Ref.[32], where the relevant parameters assumed are the same as ones used in our numerical calculations.

For the t-channel process $pp \to qt$ at the LHC, Fig.15 shows the K factors as functions of $M_{\tilde{g}}$ for $\tan\beta = 5$ and $M_0 = 150, 300\text{GeV}$, respectively. From Fig.15, we find that the SUSY QCD corrections decrease the total cross sections and the K factors approach the unit value for all parameters assumed here, which means that SUSY QCD corrections are negligible.

In Fig.16 and Fig.17 we present the LO and the SUSY QCD corrected cross sections as functions of renormalization and factorization scales $\mu/\mu_0(\mu_f = \mu_r = \mu, \mu_0 = m_t)$ for both s-channel and t-channel, respectively, assuming $\tan\beta = 5$, $M_0 = 150$GeV, $M_{1/2} = 70$GeV, $A_0 = -200$GeV and $\mu > 0$. Since the SUSY QCD corrections to the two channels are very small, they do not affect the scale dependence of the LO results obviously.

IV. CONCLUSION

In conclusion, we have calculated the SUSY QCD corrections to the total cross sections for single top production at the Tevatron and the LHC in the MSSM. Our results show that for the s-channel and t-channel, the SUSY QCD corrections are at most about 1%, but for the associated production process $pp \to tW$, the SUSY QCD corrections increase the total cross sections significantly, which can reach about 6% for most values of the parameters, and the SUSY QCD corrections should be taken into consideration in the future high precision experimental analysis for top physics at the LHC.

Appendix

In this Appendix, we will list the explicit expressions of the non-zero form factors of associated production and s-channel. For simplicity, we first define the abbreviations for Passarino-Veltman functions [42] below.

$$B_0^s = B_0(s, M_{\tilde{g}}^2, M_{\tilde{t}_i}^2), \qquad B_1^s = B_1(s, M_{\tilde{g}}^2, M_{\tilde{t}_i}^2), \qquad {B'}_0^s = B_0(s, M_{\tilde{g}}^2, M_{\tilde{b}_i}^2),$$

$$B_0^t = B_0(t, M_{\tilde{g}}^2, M_{\tilde{t}_i}^2), \qquad B_1^t = B_1(t, M_{\tilde{g}}^2, M_{\tilde{t}_i}^2),$$

$$C_{ijk\cdots}^a = C_{ijk\cdots}(m_t^2, s, m_W^2, M_{\tilde{t}_i}^2, M_{\tilde{g}}^2, M_{\tilde{b}_j}^2),$$

$$C^b_{ijk\cdots} = C_{ijk\cdots}(0, t, m_W^2, M^2_{\tilde{b}_i}, M^2_{\tilde{g}}, M^2_{\tilde{t}_j}),$$

$$C^c_{ijk\cdots} = C_{ijk\cdots}(m_t^2, t, 0, M^2_{\tilde{g}}, M^2_{\tilde{t}_i}, M^2_{\tilde{g}}),$$

$$C^d_{ijk\cdots} = C_{ijk\cdots}(m_t^2, t, 0, M^2_{\tilde{t}_i}, M^2_{\tilde{g}}, M^2_{\tilde{t}_i}),$$

$$C^e_{ijk\cdots} = C_{ijk\cdots}(m_t^2, t, 0, M^2_{\tilde{g}}, M^2_{\tilde{t}_i}, M^2_{\tilde{t}_i}),$$

$$C^f_{ijk\cdots} = C_{ijk\cdots}(0, s, 0, M^2_{\tilde{g}}, M^2_{\tilde{b}_i}, M^2_{\tilde{g}}),$$

$$C^g_{ijk\cdots} = C_{ijk\cdots}(0, s, 0, M^2_{\tilde{b}_i}, M^2_{\tilde{g}}, M^2_{\tilde{b}_i}),$$

$$C^h_{ijk\cdots} = C_{ijk\cdots}(0, u, m_t^2, M^2_{\tilde{g}}, M^2_{\tilde{b}_i}, M^2_{\tilde{t}_j}),$$

$$C^i_{ijk\cdots} = C_{ijk\cdots}(m_W^2, m_t^2, s, M^2_{\tilde{b}_i}, M^2_{\tilde{t}_j}, M^2_{\tilde{g}}),$$

$$C^A_{ijk\cdots} = C_{ijk\cdots}(0, s, 0, M^2_{\tilde{g}}, M^2_{\tilde{u}_i}, M^2_{\tilde{d}_j}),$$

$$C^B_{ijk\cdots} = C_{ijk\cdots}(m_t^2, s, 0, M^2_{\tilde{g}}, M^2_{\tilde{t}_i}, M^2_{\tilde{b}_j}),$$

$$D^a_{ijk\cdots} = D_{ijk\cdots}(0, m_W^2, m_t^2, 0, t, s, M^2_{\tilde{g}}, M^2_{\tilde{b}_i}, M^2_{\tilde{t}_j}, M^2_{\tilde{g}}),$$

$$D^b_{ijk\cdots} = D_{ijk\cdots}(0, s, m_W^2, u, 0, m_t^2, M^2_{\tilde{b}_i}, M^2_{\tilde{g}}, M^2_{\tilde{b}_i}, M^2_{\tilde{t}_j}),$$

$$D^c_{ijk\cdots} = D_{ijk\cdots}(m_t^2, t, m_W^2, u, 0, 0, M^2_{\tilde{t}_i}, M^2_{\tilde{g}}, M^2_{\tilde{t}_i}, M^2_{\tilde{b}_j}).$$

For s-channel, we have

$$f_1^s = -\sum_{\substack{q=u,c\\ q'=d,s,b}} \sum_{i,j=1}^{2} \frac{8\alpha\alpha_s V_{tb} V^*_{qq'}}{3\sin^2\theta_W (s-m_W^2)} (U^q_{i1} U^{q'}_{j1} U^{q*}_{i1} U^{q'*}_{j1} C^A_{00} + U^t_{i1} U^b_{j1} U^{t*}_{i1} U^{b*}_{j1} C^B_{00}),$$

$$f_2^s = -\sum_{\substack{q=u,c\\ q'=d,s,b}} \sum_{i,j=1}^{2} \frac{8\alpha\alpha_s V_{tb} V^*_{qq'}}{3\sin^2\theta_W (s-m_W^2)} U^q_{i2} U^{q'}_{j1} U^{q*}_{i1} U^{q'*}_{j2} C^A_{00},$$

$$f_3^s = -\sum_{\substack{q=u,c\\ q'=d,s,b}} \sum_{i,j=1}^{2} \frac{8\alpha\alpha_s V_{tb} V^*_{qq'}}{3\sin^2\theta_W (s-m_W^2)} M_{\tilde{g}} U^q_{i2} U^{q'}_{j1} U^{q*}_{i1} U^{q'*}_{j1} (C^A_0 + C^A_1 + C^A_2),$$

$$f_4^s = -\sum_{\substack{q=u,c\\ q'=d,s,b}} \sum_{i,j=1}^{2} \frac{8\alpha\alpha_s V_{tb} V^*_{qq'}}{3\sin^2\theta_W (s-m_W^2)} M_{\tilde{g}} U^q_{i1} U^{q'}_{j1} U^{q*}_{i1} U^{q'*}_{j2} (C^A_0 + C^A_1 + C^A_2),$$

$$f_5^s = -\sum_{\substack{q=u,c\\ q'=d,s,b}} \sum_{i,j=1}^{2} \frac{8\alpha\alpha_s V_{tb} V^*_{qq'}}{3\sin^2\theta_W (s-m_W^2)} [M_{\tilde{g}} U^t_{i1} U^b_{j2} U^{t*}_{i1} U^{b*}_{j1} (C^B_0 + C^B_1 + C^B_2)$$

$$+ m_t U^t_{i1} U^b_{j2} U^{t*}_{i2} U^{b*}_{j1} (C^B_1 + C^B_{11} + C^B_{12})],$$

$$f_6^s = -\sum_{\substack{q=u,c\\ q'=d,s,b}}\sum_{i,j=1}^{2}\frac{8\alpha\alpha_s V_{tb}V^*_{qq'}}{3\sin^2\theta_W(s-m_W^2)}[m_t U^t_{i1}U^b_{j1}U^{t*}_{i1}U^{b*}_{j1}(C^B_1+C^B_{11}+C^B_{12})$$

$$+M_{\tilde{g}}U^t_{i1}U^b_{j1}U^{t*}_{i2}U^{b*}_{j1}(C^B_0+C^B_1+C^B_2)],$$

$$f_7^s = \sum_{\substack{q=u,c\\ q'=d,s,b}}\sum_{i,j=1}^{2}\frac{4\alpha\alpha_s V_{tb}V^*_{qq'}}{3\sin^2\theta_W(s-m_W^2)}m_t M_{\tilde{g}}U^q_{i2}U^{q'}_{j1}U^{q*}_{i1}U^{q'*}_{j1}(C^A_0+2C^A_2),$$

$$f_8^s = \sum_{\substack{q=u,c\\ q'=d,s,b}}\sum_{i,j=1}^{2}\frac{4\alpha\alpha_s V_{tb}V^*_{qq'}}{3\sin^2\theta_W(s-m_W^2)}m_t M_{\tilde{g}}U^q_{i1}U^{q'}_{j1}U^{q*}_{i1}U^{q'*}_{j2}(C^A_0+2C^A_2),$$

$$f_9^s = -\sum_{\substack{q=u,c\\ q'=d,s,b}}\sum_{i,j=1}^{2}\frac{8\alpha\alpha_s V_{tb}V^*_{qq'}}{3\sin^2\theta_W(s-m_W^2)}C^B_{00}U^t_{i1}U^b_{j2}U^{t*}_{i2}U^{b*}_{j1}.$$

For associated production, we calculate the individual diagram separately by different types, as shown in Fig.3 and Eq.(8). The form factors of the self-energy diagrams are

$$f_1^{self} = -\frac{2\sqrt{2}\alpha_s g_s e V_{tb}}{3\pi s\sin\theta_W}\sum_i^2 M_{\tilde{g}}U^b_{i2}U^{b*}_{i1}B^s_0,$$

$$f_7^{self} = \frac{\sqrt{2}\alpha_s g_s e V_{tb}}{3\pi\sin\theta_W}\sum_i^2\{\frac{1}{s}U^b_{i1}U^{b*}_{i1}B^s_1 - \frac{1}{(t-m_t^2)^2}[M_{\tilde{g}}m_t(U^t_{i2}U^{t*}_{i1}+U^t_{i1}U^{t*}_{i2})B^t_0$$

$$+(tU^t_{i1}U^{t*}_{i1}+m_t^2U^t_{i2}U^{t*}_{i2})B^t_1]\},$$

$$f_8^{self} = \frac{2\sqrt{2}\alpha_s g_s e V_{tb}}{3\pi s\sin\theta_W}\sum_i^2 U^b_{i1}U^{b*}_{i1}B^s_1,$$

$$f_9^{self} = -f_{15}^{self} = -\frac{2\sqrt{2}\alpha_s g_s e V_{tb}}{3\pi\sin\theta_W(t-m_t^2)^2}\sum_i^2[M_{\tilde{g}}m_t(U^t_{i2}U^{t*}_{i1}+U^t_{i1}U^{t*}_{i2})B^t_0+(tU^t_{i1}U^{t*}_{i1}+m_t^2U^t_{i2}U^{t*}_{i2})B^t_1],$$

$$f_{10}^{self} = \frac{\sqrt{2}\alpha_s g_s e V_{tb}}{3\pi s\sin\theta_W}\sum_i^2[M_{\tilde{g}}U^b_{i2}U^{b*}_{i1}B^s_0+2U^b_{i1}U^{b*}_{i1}B^s_1],$$

$$f_{17}^{self} = \frac{\sqrt{2}\alpha_s g_s e V_{tb}}{3\pi\sin\theta_W(t-m_t^2)^2}\sum_i^2[M_{\tilde{g}}(m_t^2U^t_{i1}U^{t*}_{i2}-tU^t_{i1}U^{t*}_{i2})B^t_0+m_t(m_t^2U^t_{i2}U^{t*}_{i2}-tU^t_{i2}U^{t*}_{i2})B^t_1].$$

To avoid the very long expressions, we define

$$f_m^v \equiv \sum_{\alpha=1}^{7}f_m^{v\alpha},$$

as shown in Fig.3, where

$$f_2^{v1} = f_3^{v1} = -\sum_i^2\sum_j^2\frac{4\sqrt{2}\alpha_s e g_s V_{tb}U^t_{i1}U^{b*}_{j1}}{3s\pi\sin\theta_W}[m_tU^b_{j2}U^{t*}_{i2}(C^a_1+C^a_{11}+C^a_{12})-M_{\tilde{g}}U^b_{j2}U^{t*}_{i1}C^a_1],$$

$$f_7^{v1} = \frac{1}{2} f_8^{v1} = -\frac{1}{2} f_{10}^{v1} = -\sum_i^2 \sum_j^2 \frac{4\sqrt{2}\alpha_s e g_s V_{tb} U_{i1}^t U_{j1}^{b*}}{3s\pi \sin\theta_W} U_{j1}^b U_{i1}^{t*} C_{00}^a,$$

$$f_{15}^{v1} = f_{16}^{v1} = -\sum_i^2 \sum_j^2 \frac{2\sqrt{2}\alpha_s e g_s V_{tb} U_{i1}^t U_{j1}^{b*}}{3\pi \sin\theta_W} U_{j1}^b U_{i1}^{t*} C_{12}^a,$$

$$f_{18}^{v1} = f_{19}^{v1} = -\sum_i^2 \sum_j^2 \frac{2\sqrt{2}\alpha_s e g_s V_{tb} U_{i1}^t U_{j1}^{b*}}{3s\pi \sin\theta_W} [M_{\tilde{g}} U_{j1}^b U_{i2}^{t*} C_1^a - m_t U_{j2}^b U_{i2}^{t*} (C_1^a + C_{11}^a - C_{12}^a)],$$

$$f_{20}^{v1} = f_{21}^{v1} = -\sum_i^2 \sum_j^2 \frac{4\sqrt{2}\alpha_s e g_s V_{tb} U_{i1}^t U_{j1}^{b*}}{3s\pi \sin\theta_W} [m_t U_{j1}^b U_{i1}^{t*} (C_1^a + C_{11}^a + C_{12}^a) - M_{\tilde{g}} U_{j2}^b U_{i1}^{t*} C_1^a],$$

$$f_{25}^{v1} = f_{26}^{v1} = \sum_i^2 \sum_j^2 \frac{2\sqrt{2}\alpha_s e g_s V_{tb} U_{i1}^t U_{j1}^{b*}}{3\pi \sin\theta_W} U_{j2}^b U_{i2}^{t*} C_{12}^a,$$

$$f_{27}^{v1} = \frac{1}{2} f_{30}^{v1} = -\frac{1}{2} f_{32}^{v1} = -\sum_i^2 \sum_j^2 \frac{2\sqrt{2}\alpha_s e g_s V_{tb} U_{i1}^t U_{j1}^{b*}}{3s\pi \sin\theta_W} U_{j2}^b U_{i2}^{t*} C_{00}^a,$$

$$f_{28}^{v1} = f_{29}^{v1} = -\sum_i^2 \sum_j^2 \frac{2\sqrt{2}\alpha_s e g_s V_{tb} U_{i1}^t U_{j1}^{b*}}{3s\pi \sin\theta_W} [M_{\tilde{g}} U_{j1}^b U_{i2}^{t*} C_1^a - m_t U_{j1}^b U_{i1}^{t*} (C_1^a + C_{11}^a + C_{12}^a)],$$

$$f_4^{v2} = -2 f_{19}^{v2} = \frac{4\sqrt{2}\alpha_s e g_s V_{tb}}{3\pi \sin\theta_W (t - m_t^2)} \sum_i^2 \sum_j^2 U_{j1}^t U_{i1}^{b*} (m_t U_{i2}^b U_{j2}^{t*} C_{12}^b + M_{\tilde{g}} U_{i2}^b U_{j1}^{t*} C_1^b),$$

$$f_7^{v2} = \frac{1}{2} f_9^{v2} = -\frac{1}{2} f_{15}^{v2} = -\frac{2\sqrt{2}\alpha_s e g_s V_{tb}}{3\pi \sin\theta_W (t - m_t^2)} \sum_i^2 \sum_j^2 U_{j1}^t U_{i1}^{b*} U_{i1}^b U_{j1}^{t*} C_{00}^b,$$

$$f_{16}^{v2} = \frac{2\sqrt{2}\alpha_s e g_s V_{tb}}{3\pi \sin\theta_W} \sum_i^2 \sum_j^2 U_{j1}^t U_{i1}^{b*} U_{i1}^b U_{j1}^{t*} C_{12}^b,$$

$$f_{23}^{v2} = -2 f_{29}^{v2} = \frac{4\sqrt{2}\alpha_s e g_s V_{tb}}{3\pi \sin\theta_W (t - m_t^2)} \sum_i^2 \sum_j^2 U_{j1}^t U_{i1}^{b*} (m_t U_{i1}^b U_{j1}^{t*} C_{12}^b + M_{\tilde{g}} U_{i1}^b U_{j2}^{t*} C_1^b),$$

$$f_{25}^{v2} = -2 f_{27}^{v2} = -f_{31}^{v2} = \frac{4\sqrt{2}\alpha_s e g_s V_{tb}}{3\pi \sin\theta_W (t - m_t^2)} \sum_i^2 \sum_j^2 U_{j1}^t U_{i1}^{b*} U_{i2}^b U_{j2}^{t*} C_{00}^b,$$
